SOFTWARE ENGINEERING OPPORTUNITIES

Dear Hiring Team,

I am interested in software engineering and application development opportunities where I can contribute to dependable backend systems. As a Computer Information Systems graduate student at Rivier University, I combine Python, Java and SQL with a practical interest in testing, debugging and clear technical documentation.

My portfolio includes a durable background job queue, a dependency planner and an inventory ledger. These projects explore concrete engineering concerns: recovering work after a process crash, identifying invalid schedules and preserving stock integrity when commands are repeated. Each project includes code and an interactive demonstration so its behavior can be inspected.

My independent Effect Boundary Lab investigates a narrower reliability problem: what a worker should do when an external operation may have succeeded but its confirmation is missing. The published study includes controlled failure experiments, raw evidence, a protocol and explicit limitations. This work has strengthened how I reason about ambiguous outcomes, transaction boundaries and the tradeoffs between automatic retries and manual reconciliation.

Earlier academic work includes leading SMART START, an IoT vehicle security project involving authentication-enabled ignition and sensor integration, and a supply-chain operations case study. I would welcome the opportunity to discuss how this foundation and my current systems work could support your engineering team.

Thank you for your consideration. My resume, demonstrations and research materials are available through the portfolio linked above.

Sincerely,
Vinay Muppalla
